

Abstract of the Disclosure

1 A slitter for webs, such as sheet aluminum or other metals, has a simple and effective
2 method and apparatus for controlling the movement of a strip of metallic trim into a scrap
3 reclamation system. One or more air nozzles direct a stream of air between the knife roll and the
4 trim strip in the area where the trim strip leaves the knife roll. This presses the trim strip away
5 from the knife roll, and reduces the risk that trim will adhere to the knife roll and cause
6 problems.
